

LOMPLAY

**Programmable infrastructure for live events, ticketing, and
organizer economics**

Confidential — [Founder fill-in: company legal name]

The problem

- Ticketing and event ops sit on **fragmented**, decades-old stacks
- Settlement is **opaque**; partners lack a shared source of truth
- Hard to compose **new economics** (insurance, pools, contractor terms) per show
- Fans and regulators expect **provable** inventory and audit trails – without losing UX

Why now

- **Stablecoins and wallet UX** are ready for real-world commerce rails
- **Account abstraction** lowers friction for mainstream buyers and staff flows
- Promoters need **programmable payouts** tied to on-chain rules, not spreadsheets
- **AI agents** need **machine-actionable** protocols – APIs and tools, not PDFs (*MCP / structured ops*)

Our solution

Protocol + applications

- **On-chain:** Inventory, access rules, economics, and settlement-oriented logic in **modular, upgradeable** contracts (EIP-2535 Diamond pattern)
- **Off-chain: Stageforge Pro** (promoters, buyers) and **Backstage** (platform / tenant ops) on modern web and wallet rails
- **Money:** Crypto-native settlement plus **fiat pathways** (cards, bank, rails) where the product requires them — integrated as first-class flows, not bolt-ons

Product — organizers & fans (**Stageforge Pro**)

- Event and **marketplace** surfaces for discovery and purchase
- **Smart-wallet** and treasury-style flows for holding and moving funds
- **Top-up / off-ramp** patterns for fiat ↔ crypto where configured
- **Operational consoles** for series, launches, and on-chain checklists alongside Supabase-backed ops data

Product — platform & gate (**Backstage**)

- **Multi-tenant** administration and observability for the protocol rollout
- **Gate-ops** and **staff roles** aligned to on-chain attendance and access facets
- **Reconciliation-friendly** views for payment rails (e.g. marketplace purchase / settlement monitoring)
- Shared ABI and hook discipline with the **same** contract surface promoters use — less drift, faster audits

Protocol architecture (conceptual)

- **Facets** swap without migrating user-facing proxy addresses — **controlled upgradeability**
- **Vertical facets** beyond “mint ticket”: yield vaults, pools, insurance, contractor settlement, attendance — **one stack**, not ten vendors

Defensibility (capabilities, not hype)

- **Full vertical integration:** contracts, indexer/analytics direction, and consumer + ops UIs in one program of record
- **Modular protocol:** add or replace **business slices** (facets) as the category evolves
- **Breadth:** ticketing plus **economics, gating, insurance, and settlement-shaped** primitives competitors rarely ship as one system
- **Agent-shaped surface:** protocol exposed to **tools and resources** for LLM-driven workflows (direction: MCP server, generative UI)

What we're building next (*themes from product roadmap*)

- **Access control / gate program:** validator experiences, rotating credentials, offline-tolerant ops (*per access-control PRD track*)
- **Wallet & rails hardening:** KMS, webhooks, reconciliation — production-grade **fiat** → **on-chain** paths
- **ECVA / event intelligence:** AI-assisted concept validation, campaigns, analytics (*backlog PRDs — phased*)
- **Compliance toolkit:** jurisdiction-specific exports and audit artifacts (*e.g. regulatory PRD themes — [Founder fill-in: markets]*)

Planned vs shipped: align wording with your fundraising narrative.

Business model (*hypothesis – [Founder fill-in]*)

- **Protocol or marketplace fees** on primary / secondary flows
- **SaaS or seat-based** pricing for professional promoters and venues
- **Payments margin** or partnership economics on fiat rails where applicable
- **Enterprise / white-label** organizer deployments (*optional strand – [Founder fill-in]*)

All numbers, splits, and segments: replace with your model.

Traction

Engineering and integration depth (qualitative – verify before sending):

- Modular **Diamond** smart-contract system with broad facet coverage and **automated test discipline** (Hardhat / Foundry in contract repo)
- **Stageforge Pro** and **Backstage** wired to the same protocol ABIs and operational patterns
- Active **PRD / coverage program** culture – shipping surfaces with explicit acceptance criteria

Commercial – [Founder fill-in]: design partners, pilots, LOIs, GMV, revenue *(do not leave blank in the PDF you send to Sequoia).*

Team & ask

Team — [Founder fill-in]: names, roles, relevant operating history (live events, fintech, crypto infra).

Round — [Founder fill-in]: stage, amount, instrument.

Use of funds — [Founder fill-in]: hires, audits, go-to-market, liquidity, chain deployment.

Contact — [Founder fill-in]: email / link.

Thank you
